

# Extensive Sentiment Analysis of Tweets

Ram Terli  
Siddharth Maredu  
Srinivas Yedla

NO MORE  
HATE SPEECH

# Project Proposal:

"How can identifying hate speech in tweets help businesses better manage their brand reputation online?"

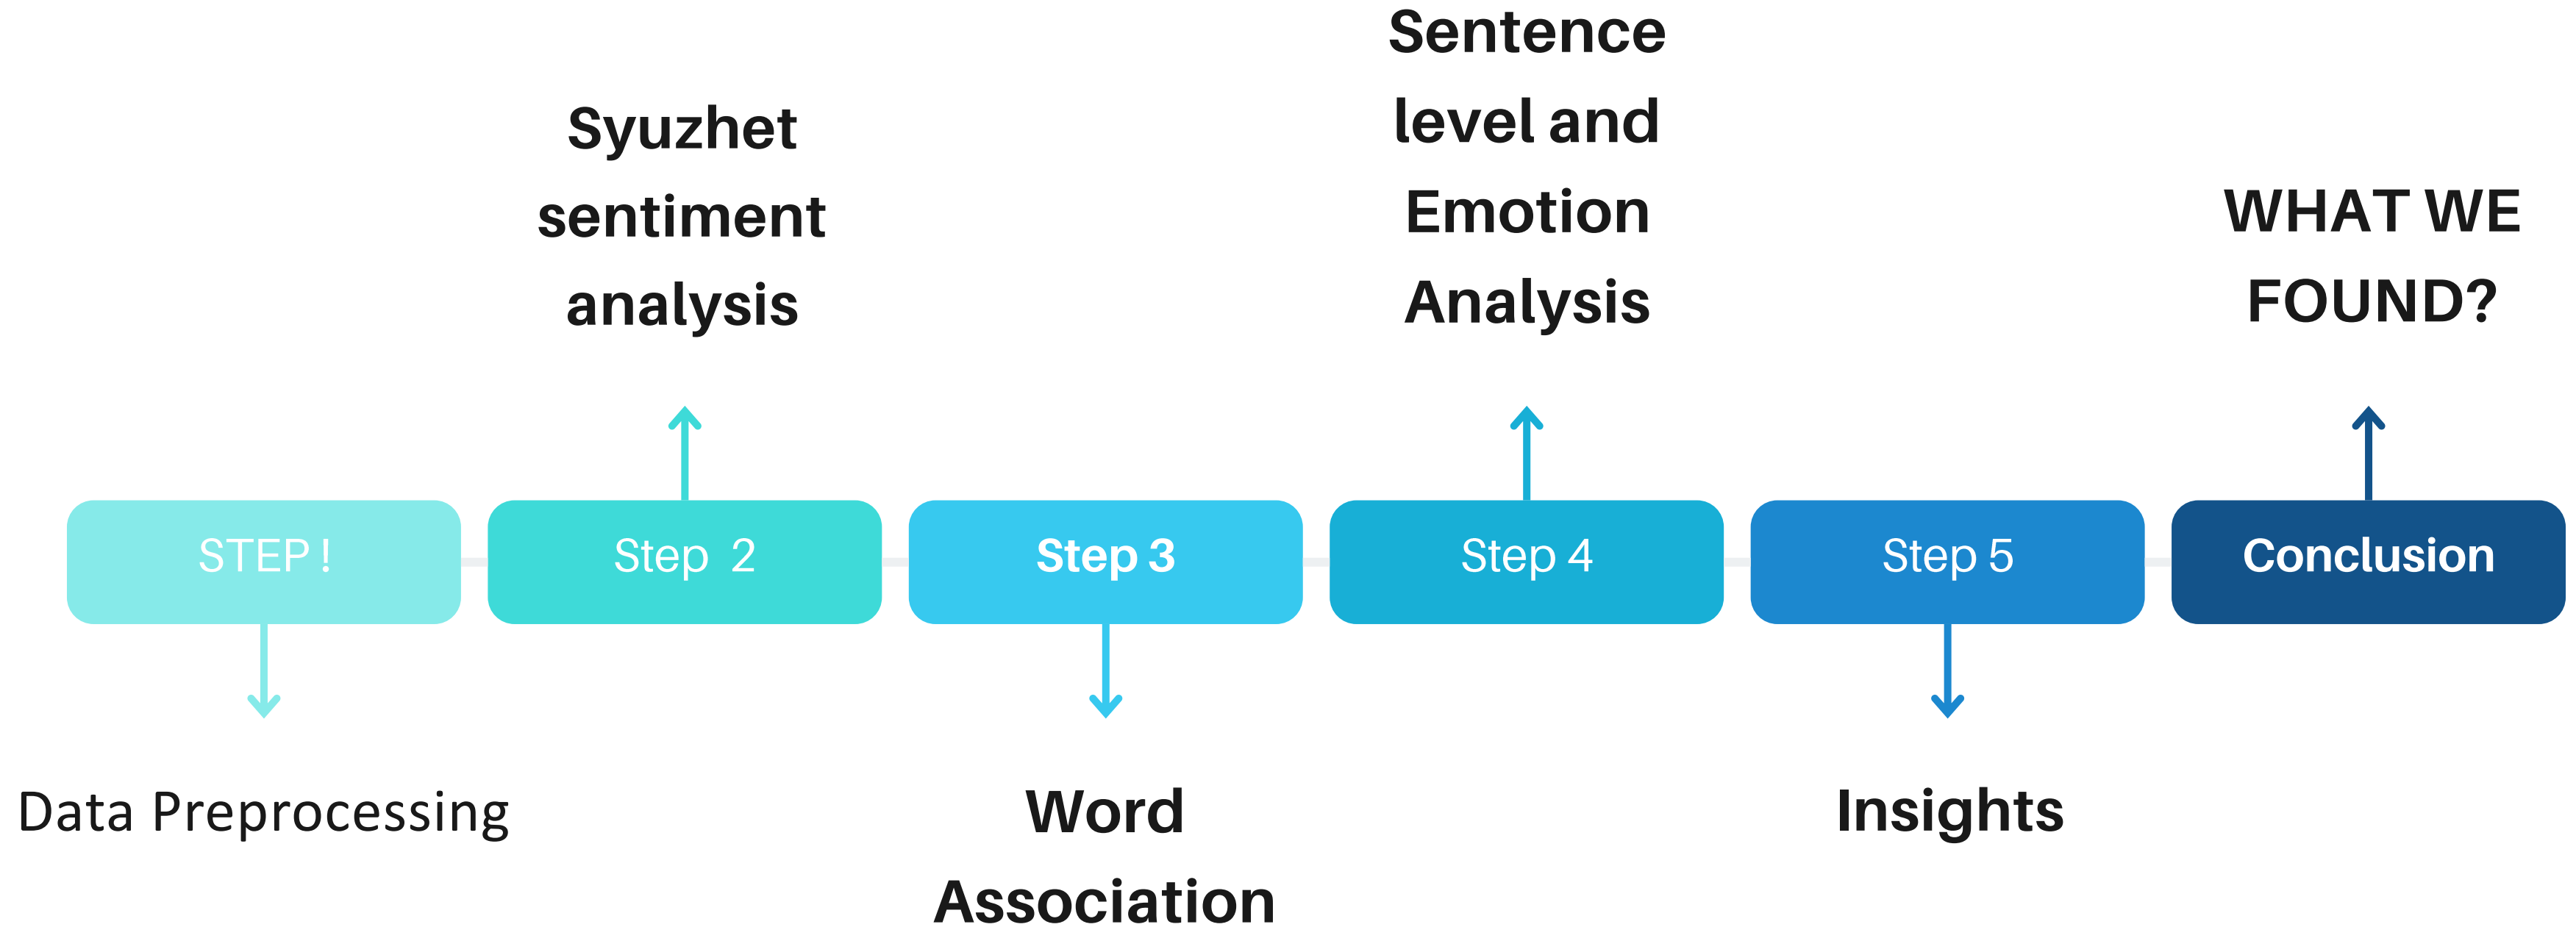

## Importance:

By identifying and mitigating hate speech, Twitter can create a safer and more positive user environment, thereby protecting its brand reputation and user engagement.

# THE PROJECT DESIGN

A brief history of what we did

# 01 - Data Preprocessing

Basic Cleaning-removed user mentions, URLs, hashtags, special characters, and extra whitespaces. It also converts text to lowercase, expands contractions, corrects common slang, and handles emojis.

Removing Stop Words-The tweets are tokenized into words, and stopwords (common words like "the", "and", etc.) are removed.  
--The length of each cleaned tweet is calculated, and non-finite values are handled.

# Syuzhet sentiment analysis

- The syuzhet method uses the NRC Emotion Lexicon to calculate sentiment scores.
- It assigns a numeric sentiment score to each tweet based on the presence of positive and negative words.

A function `classify_sentiment` is defined to classify each tweet as positive, negative, or neutral based on its sentiment score using the syuzhet package.

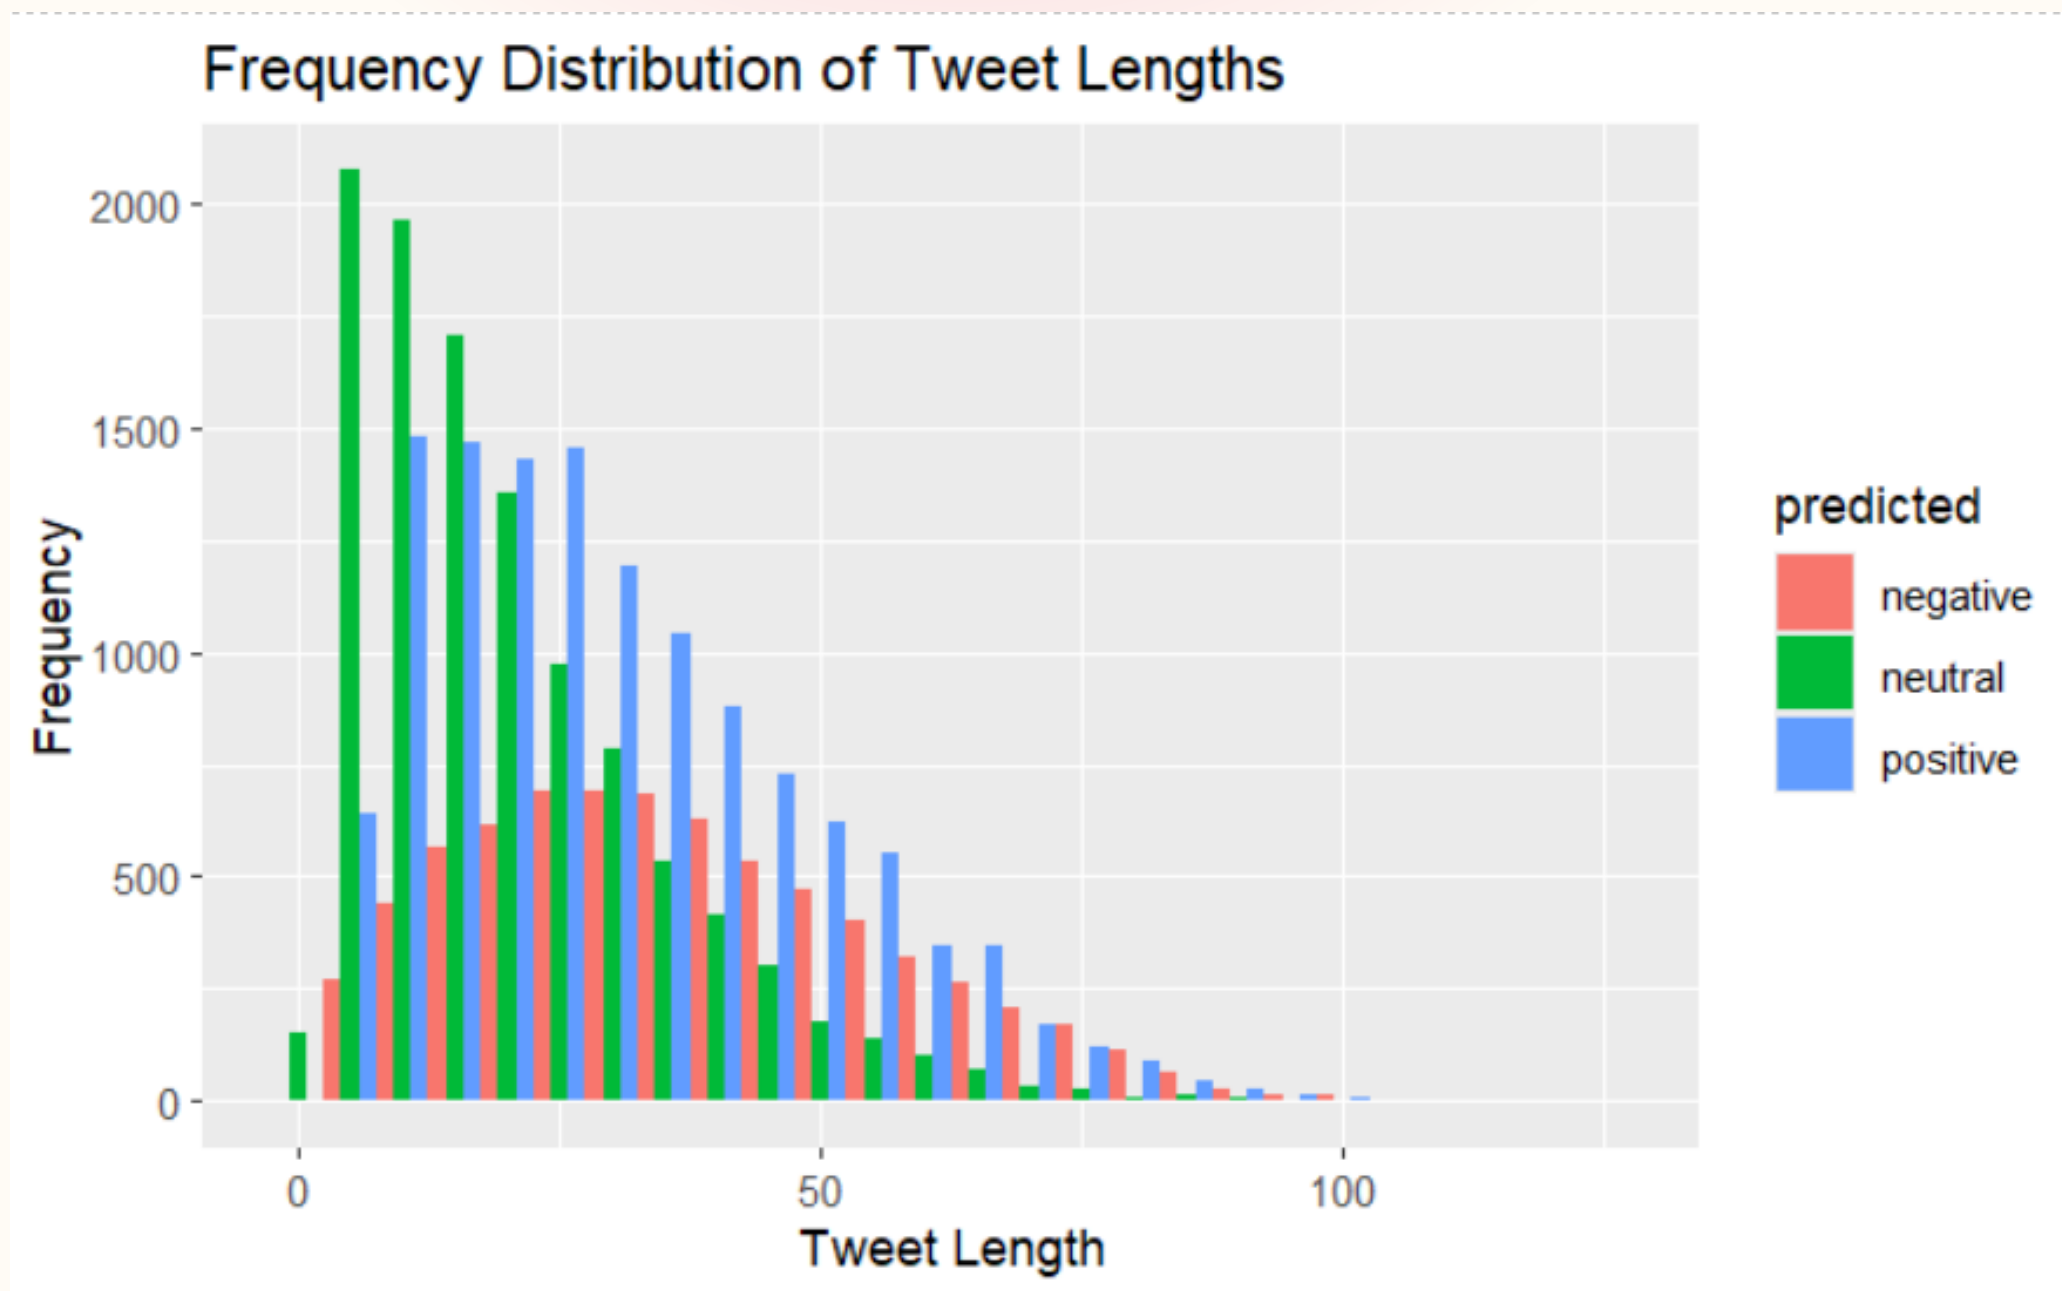

# Word Clouds

Tweets are filtered into positive, negative, and neutral based on their predicted sentiment.

# Frequency Distribution of Tweet Lengths

This plot provides us the length of each type of tweet classified by sentiment. This gives us an insight about how each tweet can be possibly classified into just based on length.

visualize associations

# WORD ASSOCIATION BY SENTIMENT

# WORD ASSOCIATION BY SENTIMENT:

## Word clouds

A word cloud representing positive sentiment. The most prominent words are 'vibes', 'positive', and 'attitude' in large, bold, dark grey letters. Other visible words include 'black', 'ice', 'people', 'summer', 'weekend', 'yields', 'sending', 'dont', and 'day'.

A word cloud representing negative sentiment. The most prominent words are 'letting', 'emotions', and 'easily' in large, bold, red letters. Other visible words include 'negative', 'people', 'thankful', 'freedom', 'play', 'is', 'vibe', 'roy', 'use', 'don't', 'fuck', 'external', 'happy', 'life', 'health', 'triple', 'ken', 'ibj', and 'friends'.

A word cloud representing happy sentiment. The most prominent words are 'happy', 'day', 'love', and 'time' in large, bold, blue letters. Other visible words include 'people', 'morning', 'world', 'thankful', 'fathers', 'feel', 'sad', 'bihday', 'week', 'night', 'bull', 'friday', 'weekend', 'tomorrow', 'wait', 'ready', 'tonight', 'check', 'family', 'wait', 'bull', 'friday', 'weekend', 'tomorrow', 'wait', 'ready', 'tonight', 'check', 'family'.

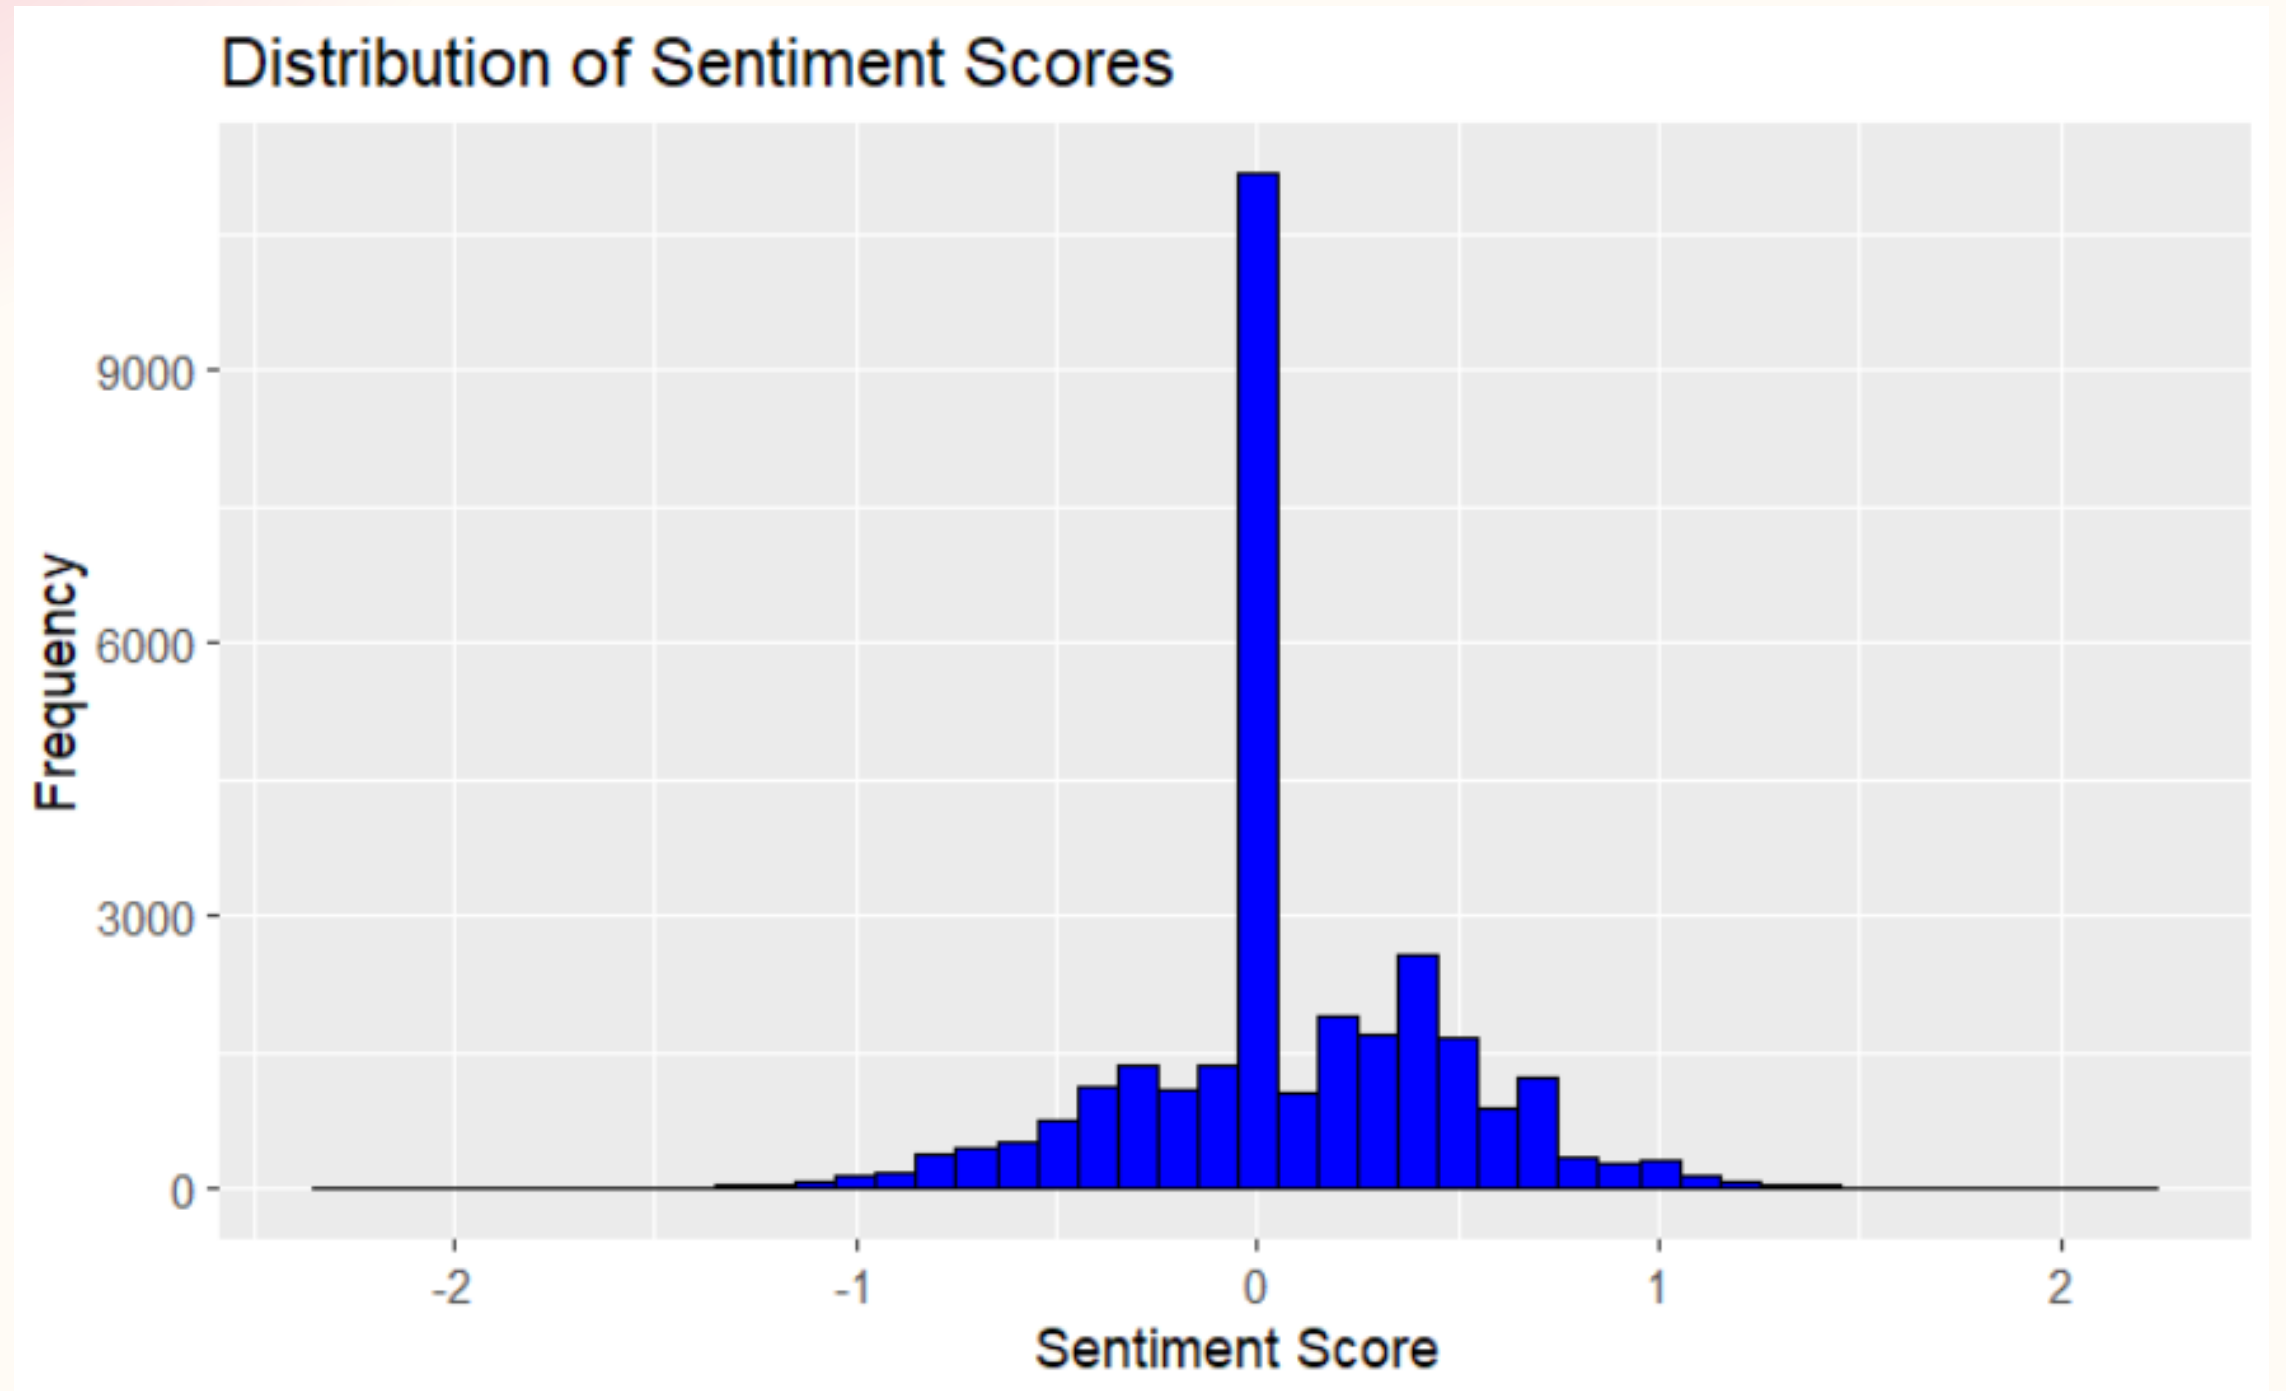

# SENTIMENTS USING SENTENCE LEVEL ANALYSIS

The `sentimentr` package is designed to analyze sentiment at the sentence level, which allows for more nuanced sentiment analysis compared to word-level methods.

# SENTIMENT SCORE DISTRIBUTION

negative	neutral	positive
7576	10628	12476

# EMOTIONAL ANALYSIS

`get_nrc_sentiment` Function: calculates the presence of specific emotions and sentiments in each tweet using the NRC Emotion Lexicon

`nrc_sentiment` Dataframe: returns a dataframe where each row corresponds to a tweet, and each column represents the count of words associated with a particular emotion or sentiment.

	anger	anticipation	disgust	fear	joy	sadness
surprise		trust				
4126	5083	10855	3790	5595	11172	4869
	9991					
negative	positive					
9950	17445					

# EMOTIONAL ANALYSIS

syuzhet Method:

Quick and straightforward way to gauge overall sentiment.

Useful for high-level sentiment trends and polarity detection.

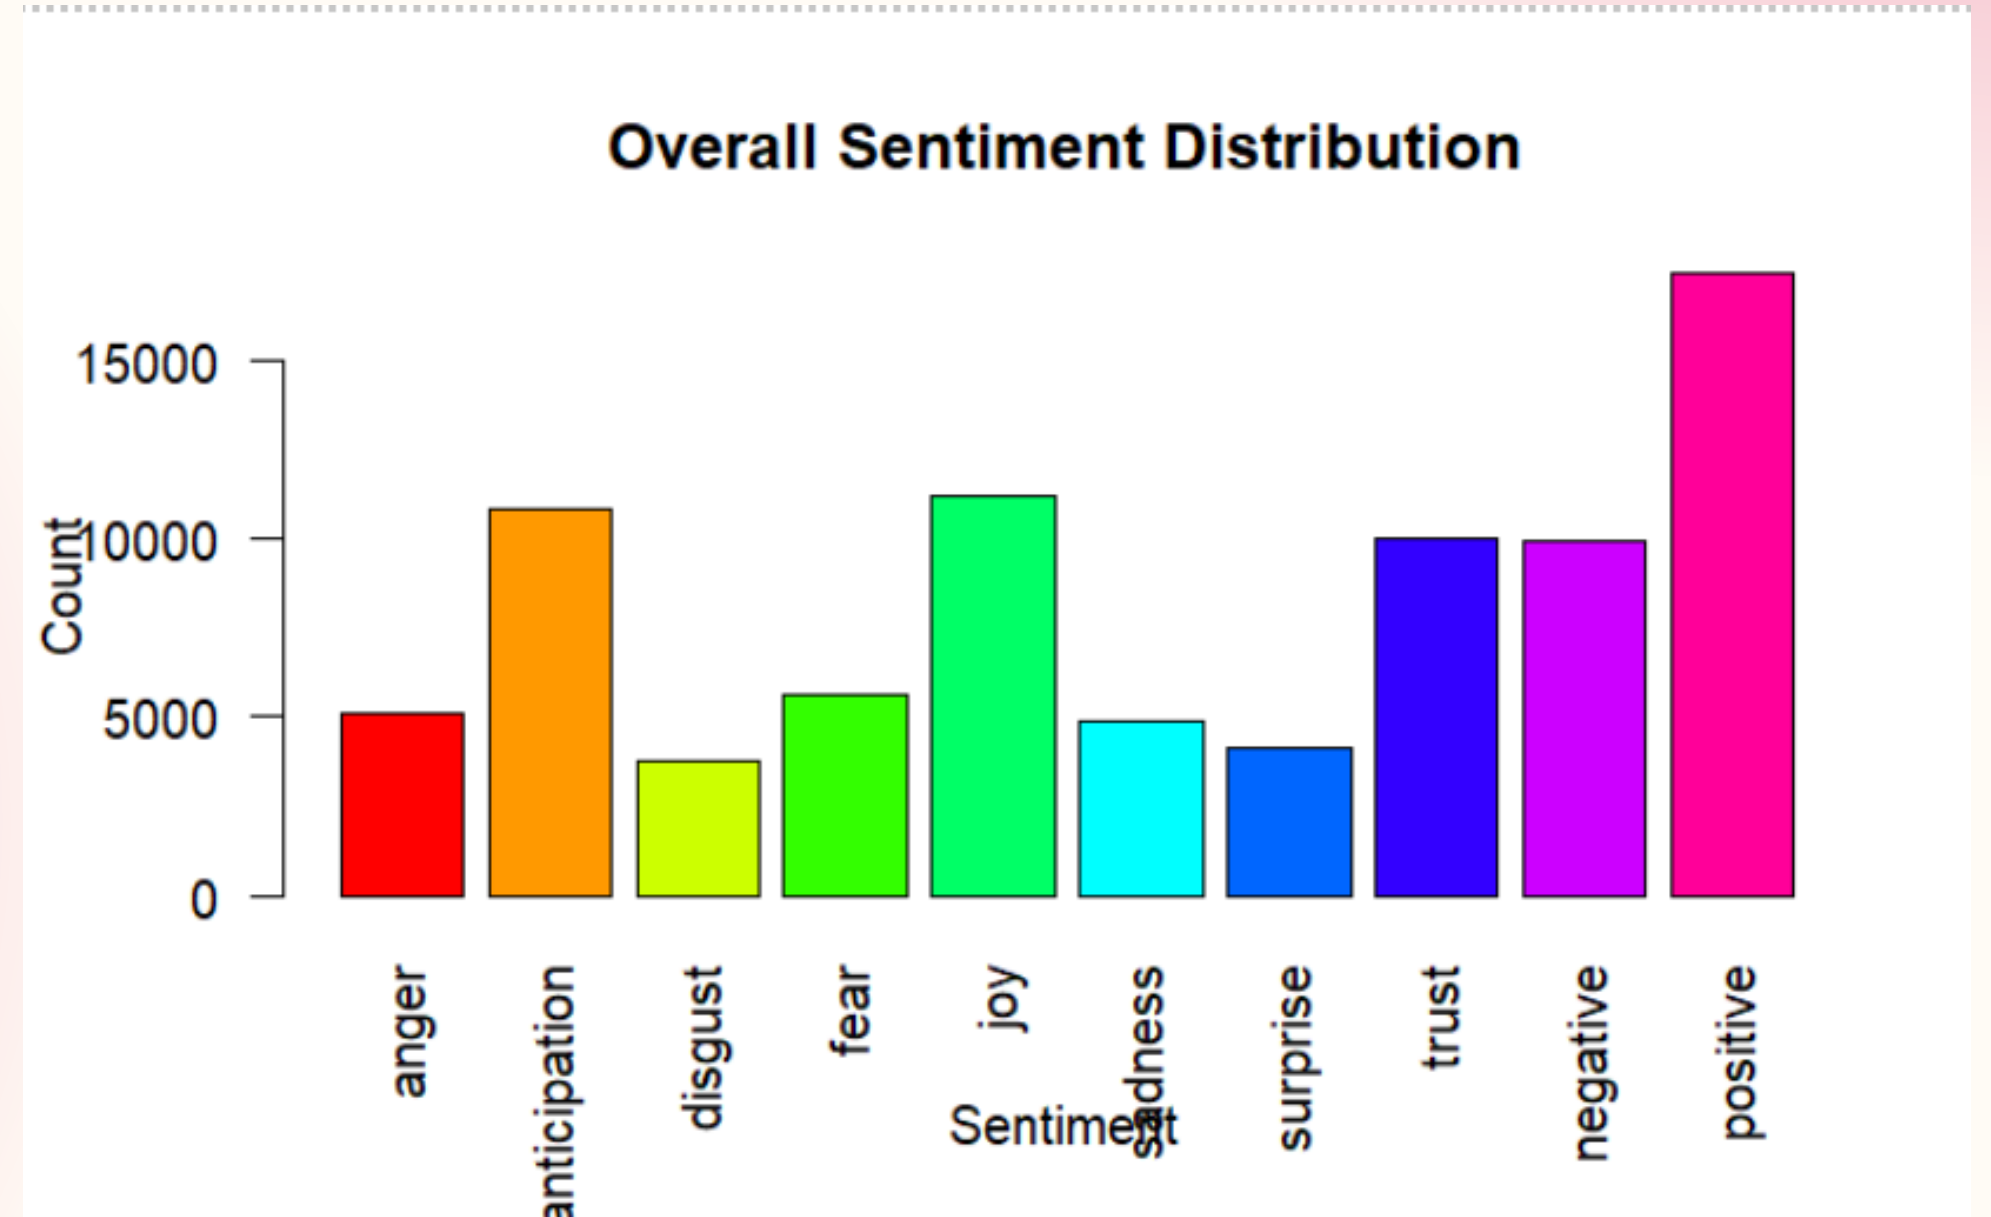

Limited in terms of emotional detail and specificity.

get\_nrc\_sentiment Method:

Provides a comprehensive emotional profile.

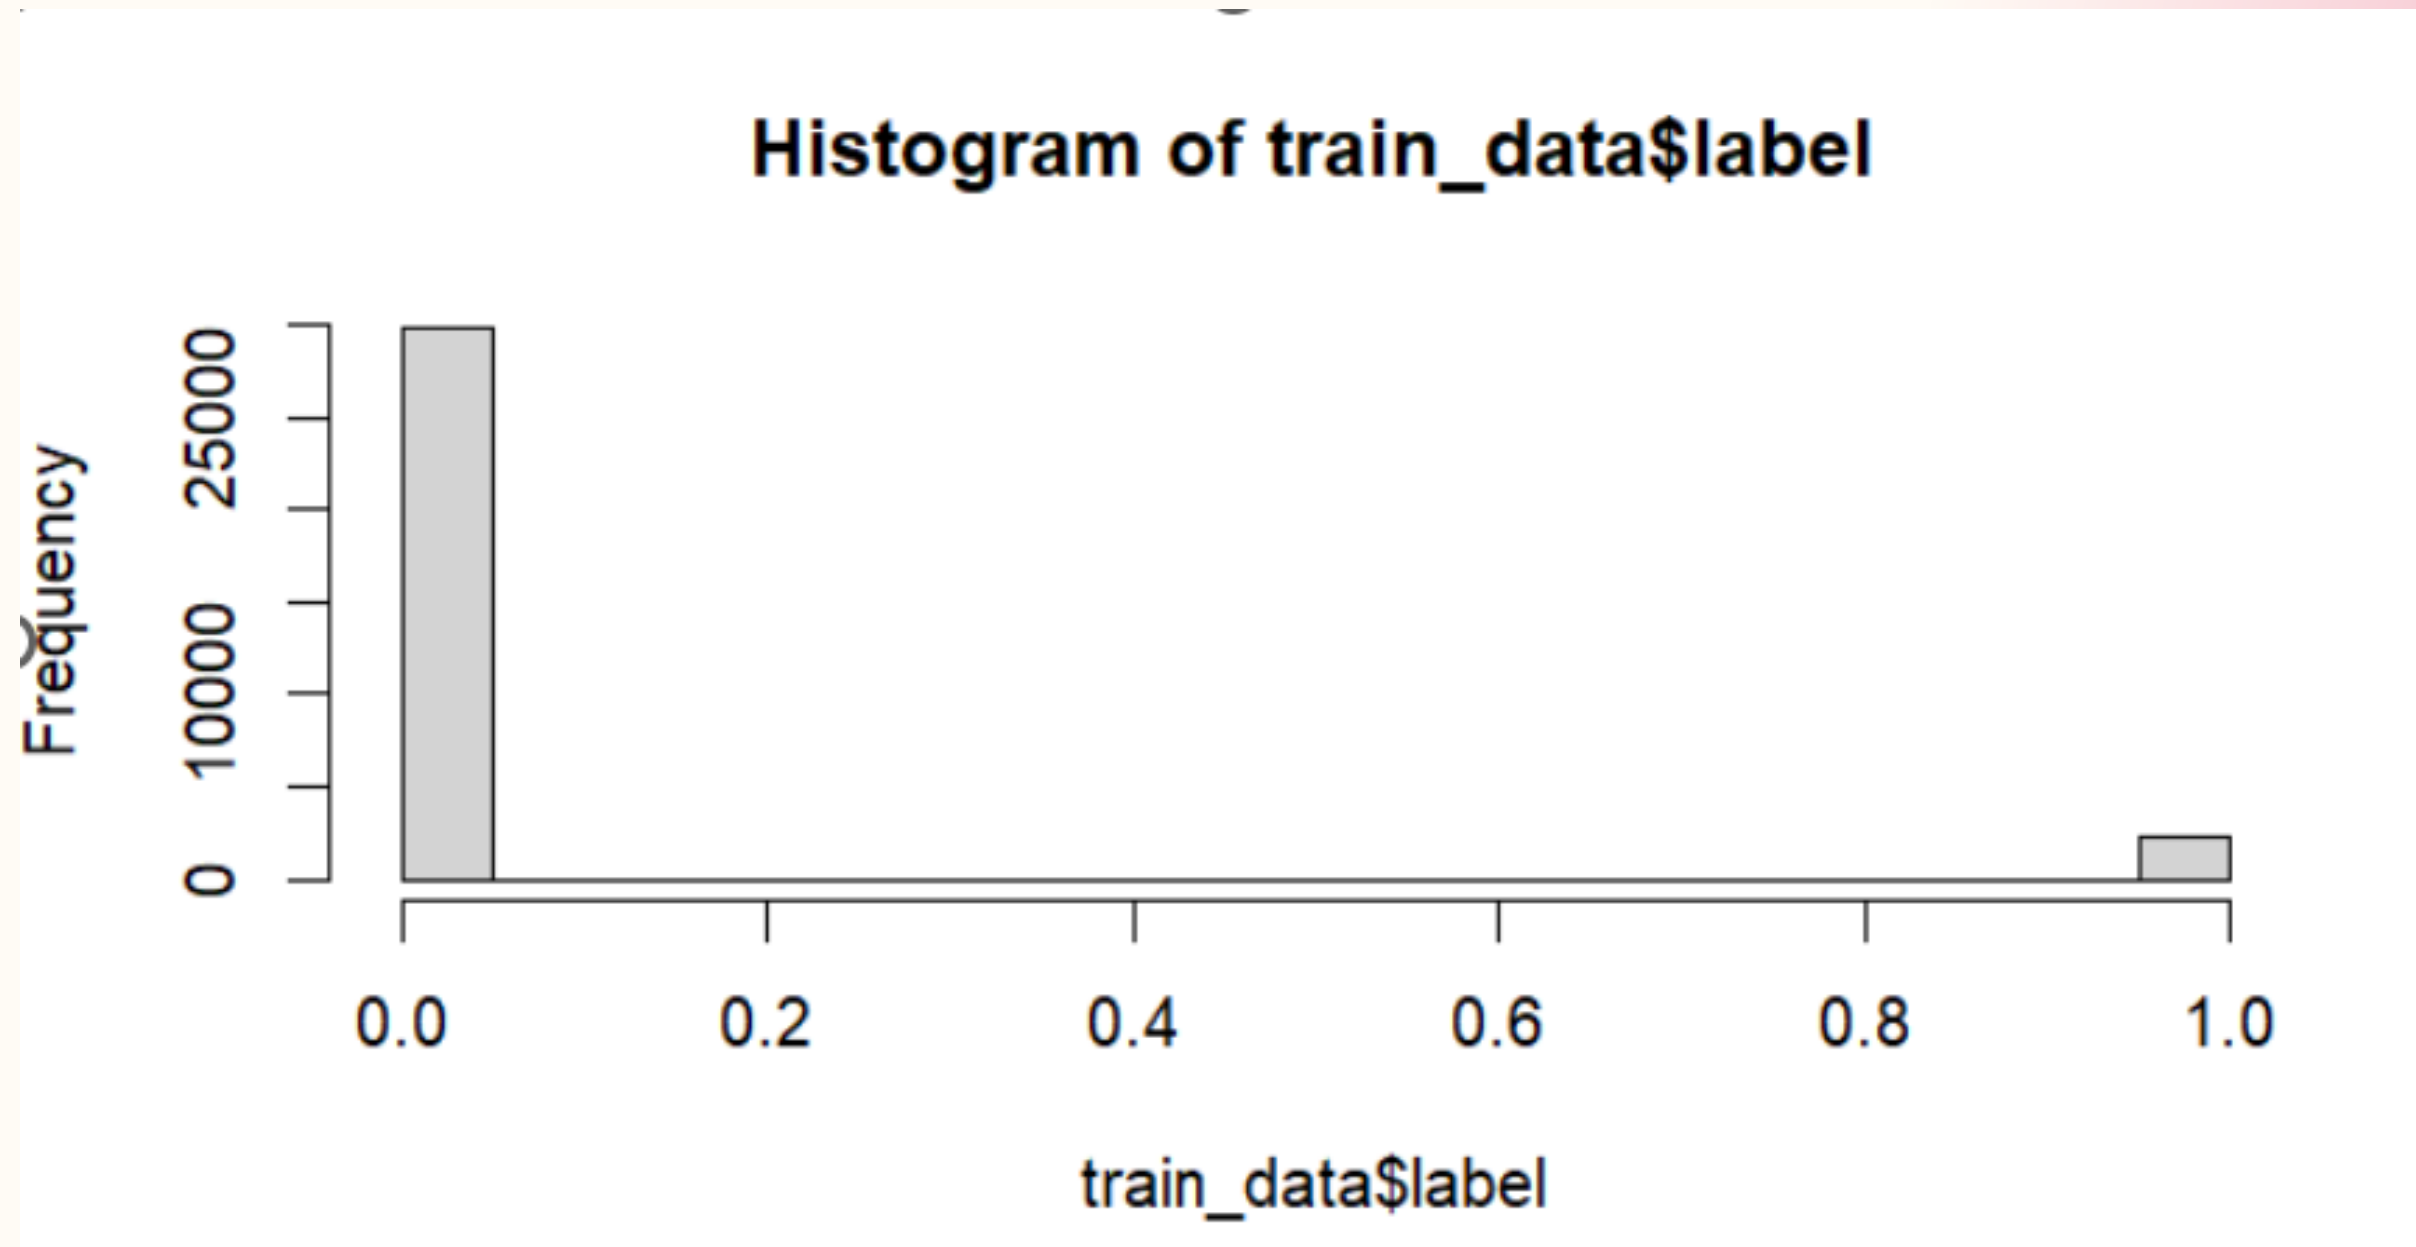

Useful for detailed emotional analysis, helping to understand not just whether the sentiment is positive or negative, but also the specific emotions driving that sentiment.

More complex output that requires more detailed analysis but provides richer insights.

# INSIGHTS

# Conclusion

Robust analysis to identify sentiments  
of tweets.  
Valuable insights for twitter business  
to handle ethical implications of their  
platform  
Awareness for Investors
